

Orange Hawkweed

Native range: Europe

Stem: Up to two feet tall. Leafless and covered with stiff black hairs.

Leaves: May have an occasional small leaf near the mid-point.

Flowers: Usually about one inch in diameter. Red on the outside and blend to form an orange center.

Roots: Perennial plant with shallow, fibrous roots.

New plants: New plants are formed from seeds, stolons and/or rhizomes.

For over 60 years, the Nez Perce Soil and Water Conservation District (NPSWCD) has maintained a firm commitment to, and solid level of support for, the conservation, wise use and management of Nez Perce County's natural resources.

Today, the NPSWCD continues to meet the needs of landowners and land users throughout the area. While providing the public with a formal channel for cooperation, and assisting county, state and federal agencies in practicing resource conservation, the NPSWCD routinely offers information and technical guidance to individuals with land or resource needs and concerns.

▶ Description and Variation

Orange Hawkweed is a perennial weed that has matted hairy leaves and attractive orange looking flowers. Each flower is approximately one inch in diameter and starts on the outside as red and blends to form an orange colored center. Flowers bloom in late May to early June. The shoots have stiff black hairs on the shoot and may grow anywhere from a couple inches to two feet in height. The stem emits a milky latex when broken. The seeds are very small and plumed.

History

Orange Hawkweed was first introduced to the United States from England in 1945. It was originally used for ornamental purposes in the garden.

Habitat

Orange Hawkweed grows in meadows, grasslands, rangelands, pastures, hayfields, right-of ways, roadsides, and idle areas. Once it has been established, Orange Hawkweed will quickly develop into a continuous patch. This weed prefers well-drained, coarse textured soils that are low in sulphur.

Control

Orange Hawkweed may be controlled with herbicide, livestock grazing, and seeding grass in disturbed soil areas. For herbicide recommendations contact a licensed pesticide consultant.
